(54) Method and apparatus for handling samples and sample collection system.

(57) Method for handling blood samples (32) wherein a blood sample is absorbed into a substrate such as filter paper (30) and a sample piece (36) is taken from the filter paper from the opposite side to the absorption side. The sample piece is placed in a vessel, e.g. a sample well of an uncoated micro titration plate (45), and is dissolved in a liquid so that a sample solution is transferred to a second vessel e.g. a micro titration plate (52-54) coated for the analysis. The apparatus comprises a camera (43), which identifies the filter paper (30), locates the blood sample (32), informs the punch (47) of the location of the sample. The filter paper (30) is placed in a package (22) having openings (25) for adsorbing and punching of the sample and the covering (23) is provided with a bar code (29).

The invention relates to a method and apparatus for handling samples and a sample collection system. The samples are normally blood samples.

In the method the samples are taken onto a solid substrate like filter paper, a sample piece is punched from the filter paper at a point where the blood sample has absorbed, and the blood sample is dissolved from the sample piece to the sample solution which is conveyed to a measuring instrument for measurement. The invention also relates to an automatic sample handling apparatus for blood samples. In the sample collection
